

# General

## How can I change the calm wind definition?

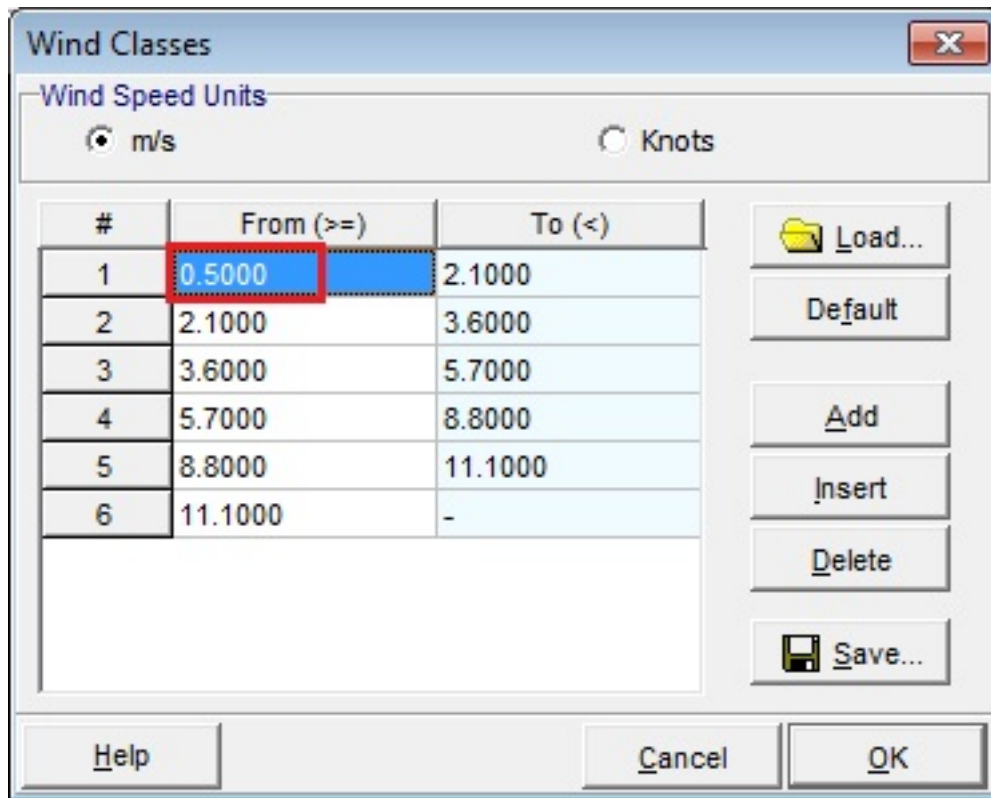

By default, calm winds are defined as less than 1 knot, or less than 1 m/s depending on the units you are using. It is possible to change this definition by editing the wind classes:

1. Click the wind classes button.

2. Edit the low end of the first wind class.

# General

The image shows a 'Wind Classes' dialog box with a title bar and a close button. It has a section for 'Wind Speed Units' with radio buttons for 'm/s' (selected) and 'Knots'. Below this is a table with 6 rows. The first row has a blue background and its 'From (>=)' value '0.5000' is highlighted with a red rectangle. To the right of the table are buttons: 'Load...' (with a folder icon), 'Default', 'Add', 'Insert', 'Delete', and 'Save...' (with a floppy disk icon). At the bottom are 'Help', 'Cancel', and 'OK' buttons.

#	From (>=)	To (<)
1	0.5000	2.1000
2	2.1000	3.6000
3	3.6000	5.7000
4	5.7000	8.8000
5	8.8000	11.1000
6	11.1000	-

All values less than the lower end of the first class will be considered calm.

**Note:** When setting your calm threshold it is a good idea to keep in mind the level of precision for wind speeds in your met file.
